Phase 1 – Hardening: Integration to Savant

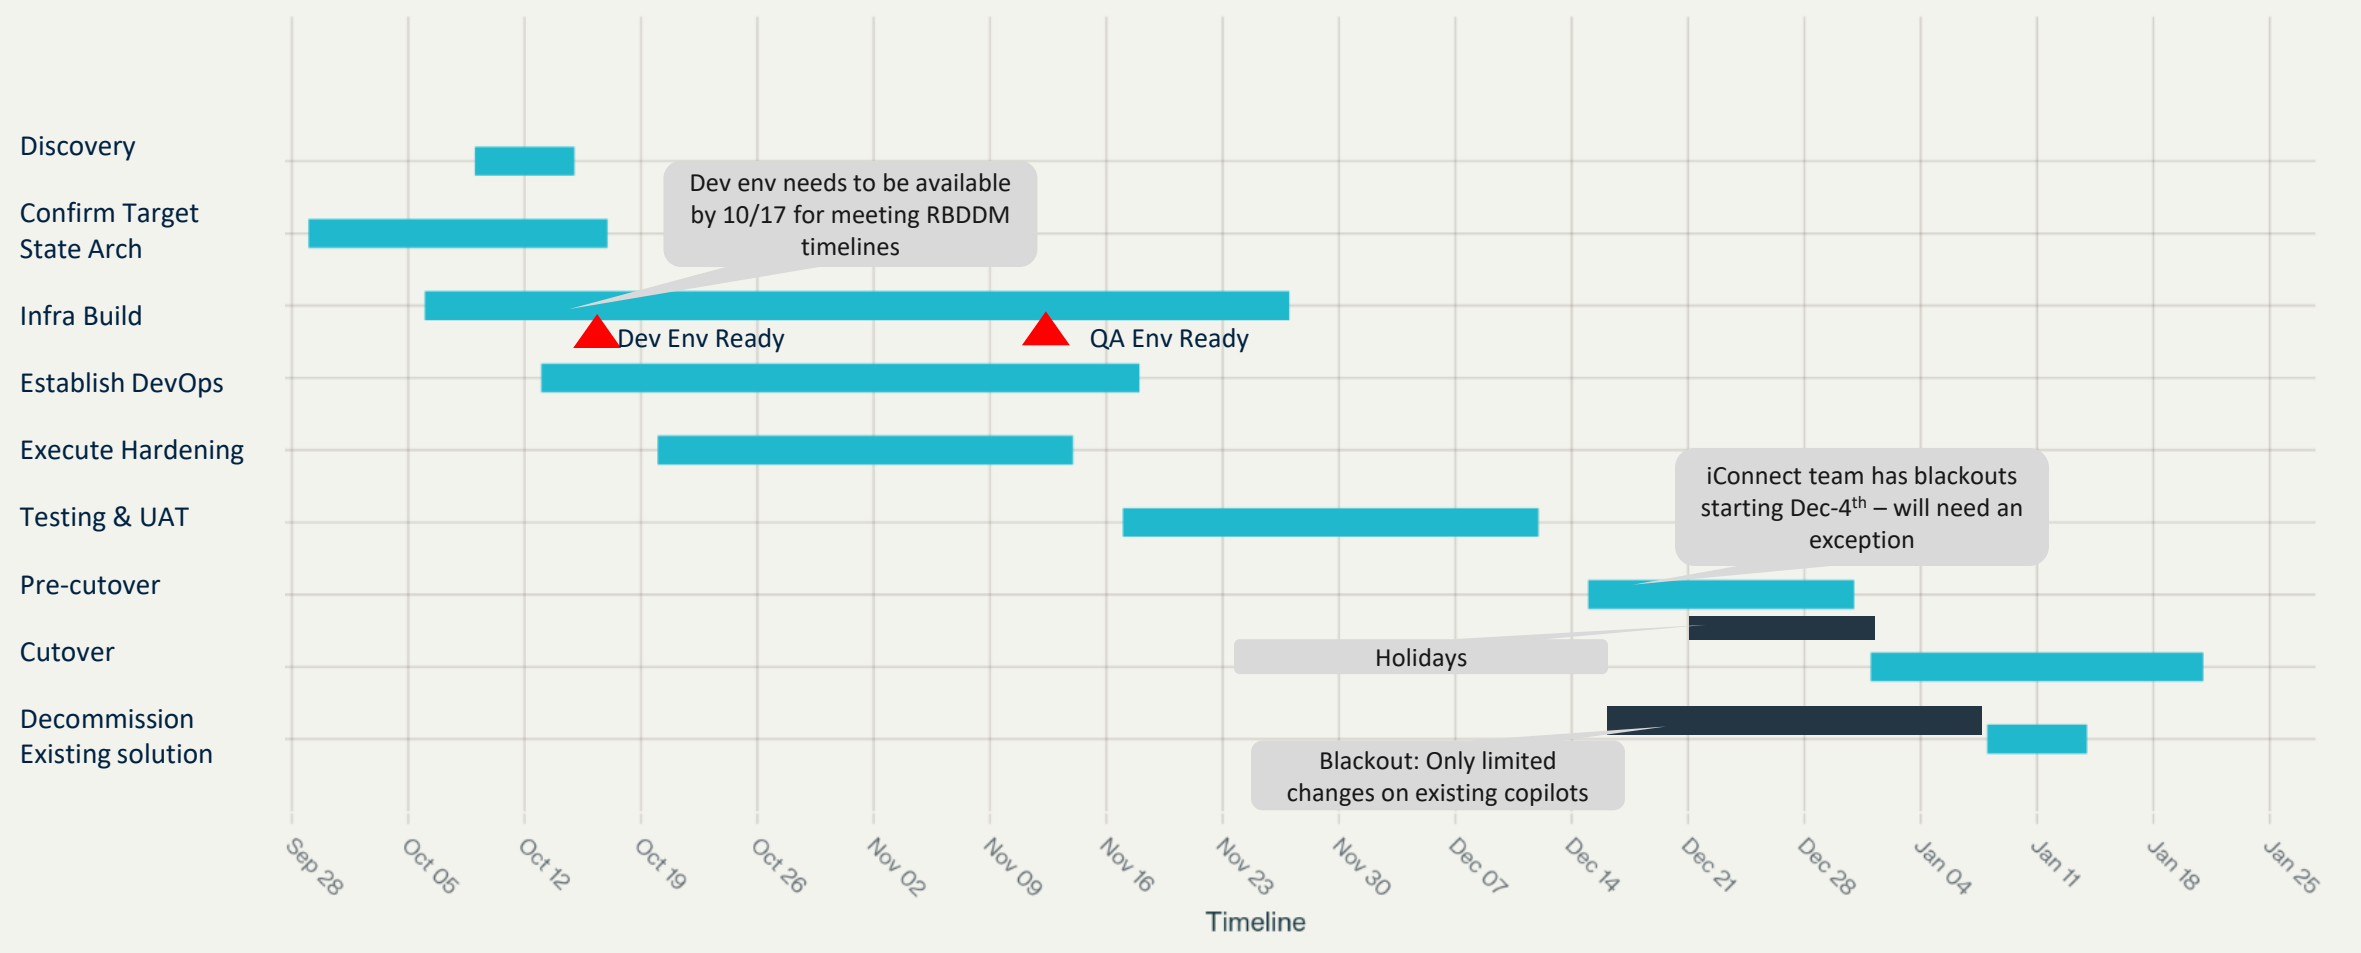

CoPilot and GenAI App Architecture

Phase 2 – Hardening: Adopt JnJ Savant Architecture into CoPilot

Phase 1 – Proposed Hardening Timeline

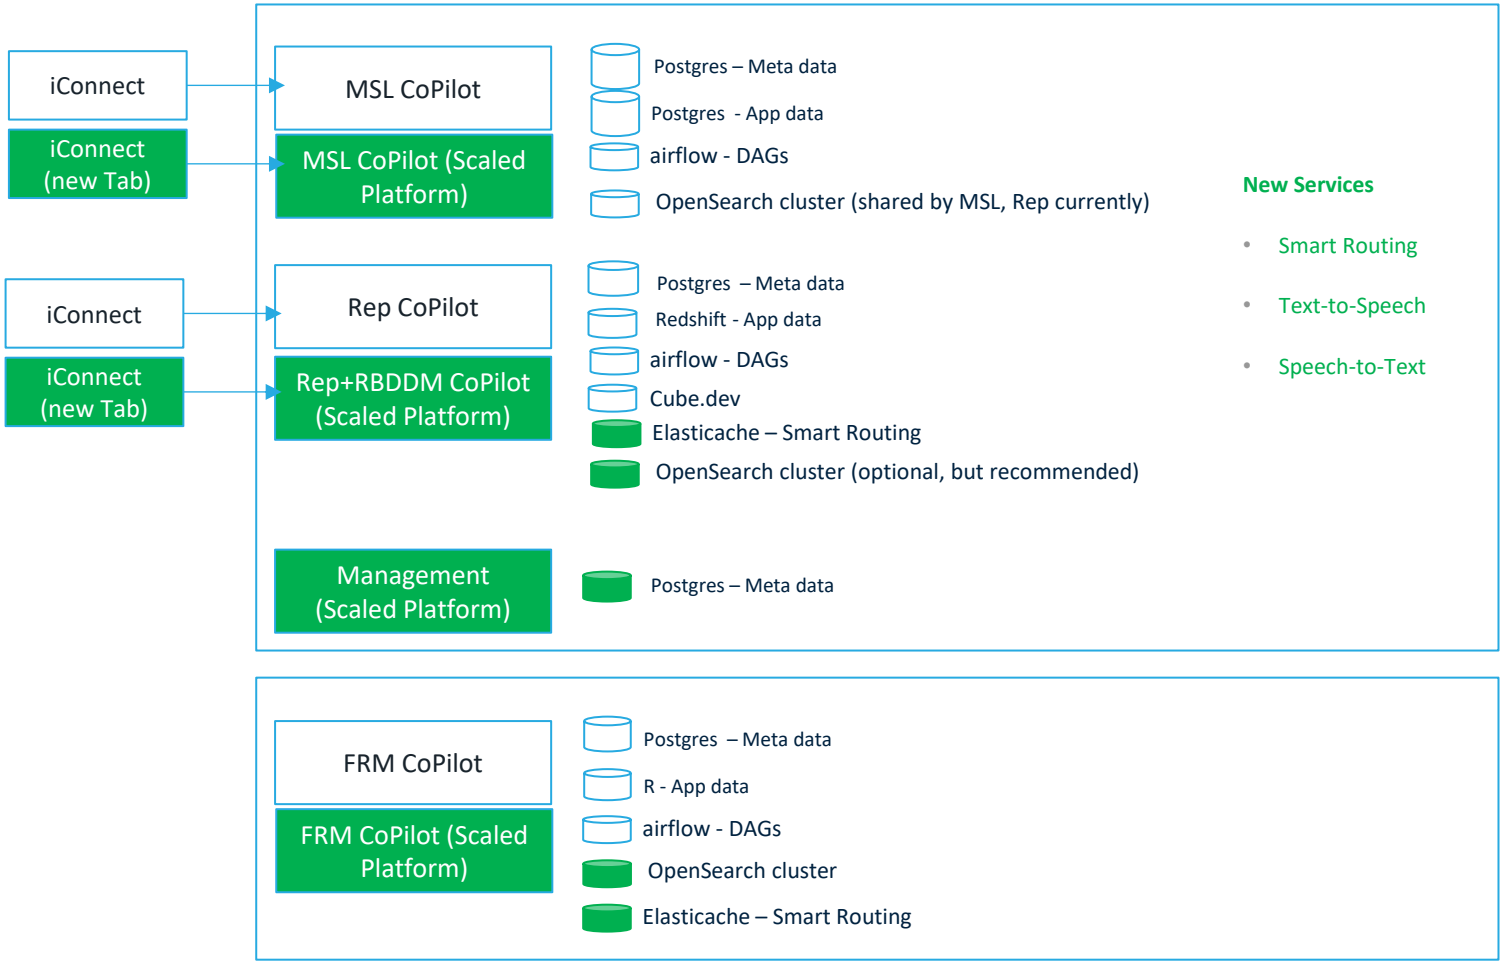

- Phase 2 timelines requires alignment of Savant timelines and Copilot

Proposed Environment Strategy – Environment Breakdown

New

Proposed Environment Strategy - Transitioning to the Scaling Platform

- Existing solution needs to be supported in parallel to support prod support activities
- Leverage new docker images
- Leverage same services using the same credentials
  - Meta data and App data also will use same schema – Hardening only incorporating CRs, etc from current copilots into it as opposed to other way around.
  - Limited cases where copilot has new development - Smart Routing, Text-to-Speech, Speech-to-Text

APPENDIX

Key Considerations for Savant Architecture

- User Experience - Performance for the field
- If roadmap will continue to grow in 2026, then DevOps will require more teams to coordinate respective roadmaps
- Savant Agent Ops need to be established to ensure troubleshooting and workflow tracking
- Need to have a deeper understanding to enable agents
  - Authentication standards for Agent 2 Agent and MCP protocol that needs to be implemented
  - Planner and orchestrator components need to be better understood
  - Meta-data transfer from components / agents for every call
  - Is there an agent registry we should register our components
  - MCP/A2A service hosting
